

## How to upload a floor plan

This Foyr | Neo provides you a powerful feature of “tracing” a floor plan that you already have.

1. Log into your **Foyr | Neo** account on [www.foyr.com/neo](http://www.foyr.com/neo) or get an account simply by signing up
2. Click on ‘**Create Project**’ as shown below

3. Enter the name of your project and click on ‘**Add Project**’

4. A **canvas** opens in a new tab

5. Click on '**Upload Floor Plan**' on the top right corner of the page

6. Select floor plan from the desktop and click on '**Open**'

**Note:** The floor plan needs to be in JPG/ PNG format only. If you have your floor plan in any other format like Autocad or PDF, you will need to export them first in an image format (or take a snapshot and save it) before using in Foyr Neo

7. Adjust the dimensions and click on **'Next'** on the bottom right of the page

8. Enter the dimensions of your floor plan in the text box titled 'Enter Line Size in Ft' and click on 'Done'

Here, you need to enter **Reference Dimensions**. This helps the software to *Scale* the entire floor plan. For example, if you know that any wall of the imported floor plan is of 10 ft. Adjust the two circles given to align with the wall and then enter 10 ft at the bottom text box. This will help the entire floor plan to be scaled automatically. This will ensure that when you trace and draw walls on top of this imported floor plan, they are of the right size.

9. Click on the canvas to paste the floor plan

10. Use the **Wall tool and Room tool** to trace the floor plan

To know more about how to use the Wall and Room tool refer to the help guide titled "How to draw a floor plan using Wall tool or Room tool from scratch"

The rest of the operations with respect to walls or changing the properties of the walls like Wall thickness, Wall colour etc are described in more detail in the next help guide 'How to draw walls and wall intersect using Wall tool'.
