

## Overview of Canvas

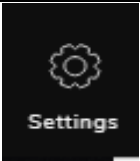

### **What is canvas?**

Canvas is your main design area. You reach the canvas, when you either click on “New Project” or an existing project to edit. This is the place where you create your designs or edit your already created designs. The Canvas has many tools, shortcuts, views and intelligent features to make professional designing easier.

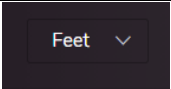

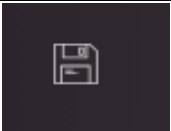

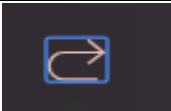

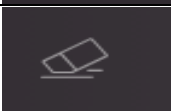

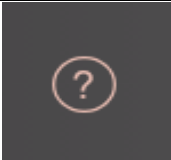

Below is a list of tools/icons which you will find on the canvas:

### **Functions on Side bar**

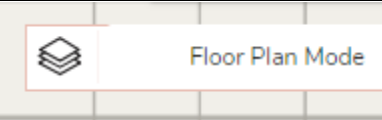

| S.No | Button/ Tool                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Icon                                                                                                 |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| 1    | <p><b>Catalogue</b> - Catalogue is a repository of all pre-modelled furniture, structural elements, storage items such as wall cabinets, paints, wall finishes etc to help you create a design. After you have created a floor plan, you will need to search the item you want to use and then drag-and-drop them on the floor plan (even structural items like Staircase etc) along with furniture, wall finishes. This can be done from Catalogue icon.</p> <p>Our repository is an ever growing list, where hundreds of new items will be added every month.</p> | <br>Catalogue     |
| 2    | <p><b>Shortlist</b> – This option helps you add all selected products from the Catalogue to your shortlist. This especially helps when you want to pick &amp; add multiple products for your project without the hassle of going through the entire catalogue again and again. For example, if you want to add a bed, carpet and side tables to your bed room, you can shortlist these items from the catalogue and then simply drag and drop from the shortlist.</p>                                                                                               | <br>Shortlist   |
| 3    | <p><b>Inspirations</b> – Inspirations are pre-modelled interior designs. These also serve as ready-made templates for you to pick from. You can choose either specific products from these pre-modelled designs or copy paste the entire model onto your project.</p>                                                                                                                                                                                                                                                                                               | <br>Inspiration |
| 4    | <p><b>Textures</b> – All paints, finishes etc for your walls, ceilings or floors can be found in this section. Pick and choose various ceiling, floor and wall textures from this option. Even textures for your products can be found here.</p>                                                                                                                                                                                                                                                                                                                    | <br>Textures    |

|   |                                                                                                                                                                                                                                                                                    |                                                                                     |
|---|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| 5 | <b>Ruler</b> – This is the measuring tape feature. With the help of ruler, measure walls and distances between products. This feature is available only in 2D mode.                                                                                                                |  |
| 6 | <b>Copy Format</b> – Use this feature to copy the texture/ material from anywhere to anywhere. For example, if you want your bed to have the same texture as your wardrobe, simply use this cool feature. This is useful when you want to give your entire room a harmonious look. |  |
| 7 | <b>Settings</b> – Settings button helps you change wall thickness, wall opacity, wall colour and wall snapping to suit your project requirements. This is especially helpful when you want to give different thicknesses to the internal walls versus external boundaries.         |  |

#### **Functions on top tool bar**

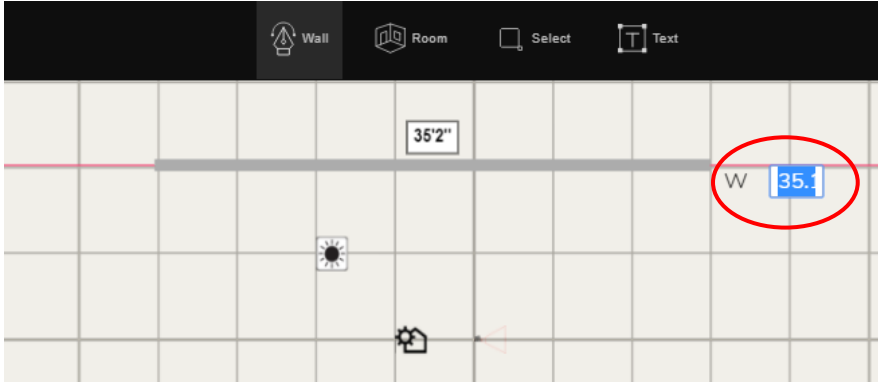

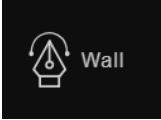

|   |                                                                                                                                                  |                                                                                       |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| 1 | <b>Feet</b> – This is the place from where you can change metrics used in your floor plan. You can select from Feet/ Inches, or Meters or Yards. |  |
| 2 | <b>Save</b> – Save your project by clicking on the floppy shaped icon. This is very important; else you might lose all your effort.              |  |
| 3 | <b>Undo</b> – Undo your previous actions by using this button. You can undo upto your previous 10 actions by repeatedly using this feature.      |  |
| 4 | <b>Redo</b> – With the help of this feature, you can redo your undo actions.                                                                     |  |
| 5 | <b>Erase</b> – With the help of this button you can erase your project and start afresh.                                                         |  |
| 6 | <b>Help</b> - This is the central place for your help and support. You can find all tutorials, help pages, contact numbers etc.                  |  |

### Icons/ Buttons on canvas sheet

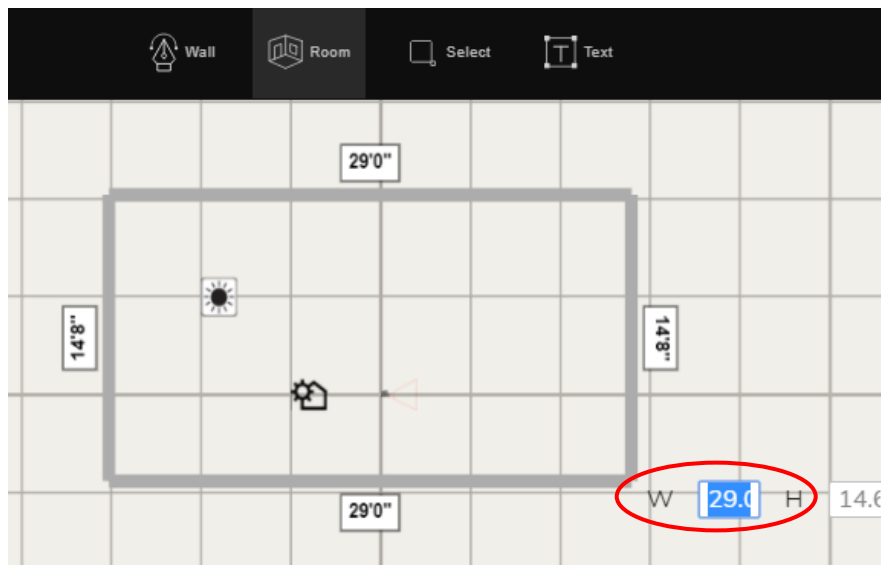

|   |                                                                                                                                                                                                                                                                                                             |                                                                                      |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| 1 | <b>2D</b> – This is the mode for 2D drawing & space planning. It provides a top plan view of your project. You can easily plan the space using this mode.                                                                                                                                                   |   |
| 2 | <b>3D</b> – This is the design mode where you can design/ view your floor plan in 3D mode and operate on objects or structures in this mode. You can move things around, or paint the walls directly in 3D.<br>You can also easily switch between 2D and 3D mode for accurately arranging your objects.     |   |
| 3 | <b>WT</b> – Walkthrough mode is a preview mode, before you take renders. Enter this mode to set camera angle. Whatever you see on the screen, becomes your default camera angle. Once you have frozen this angle, you can then access render button on the top right to fire renders for your presentation. |   |
| 4 | <b>Floor plan mode</b> – Drawing of floor plan and adding furniture to rooms is done on the floor plan mode. This is the default designing mode.                                                                                                                                                            |   |
| 5 | <b>Ceiling plan mode</b> – You can add ceiling, false ceiling or beams in the ceiling plan mode. Before you can design ceilings, you will need to enter the Ceiling Plan mode.                                                                                                                              |  |

### Buttons on the Context bar

Context bar is the intelligent menu in Foyr Neo. This is the place holder, where relevant menu items are shown based on the context where the user currently is. For example, when you are in the floor plan/ 2D mode, you can see the wall tool. When you select an object or furniture, you can see action items relevant to manipulating the object properties.

| S.No. | Button/ Tool                                                                                                                                                                                                                                                                      | Icon                                                                                  |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| 1     | <p><b>Wall Tool</b> - The nib-shaped <b>Wall</b> tool helps you draw straight lines/walls on the floor plan.<br/>The tool also provides a text box for you to enter accurate wall length</p>  |  |
| 2     | <p><b>Room Tool</b> – The <b>Room</b> tool helps you draw square or rectangular rooms on a floor plan<br/>The tool also provides a text box for you to enter accurate room</p>                                                                                                    |  |

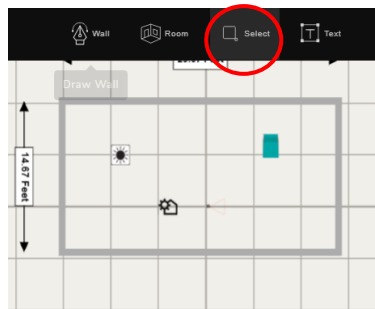

dimensions. For example, to create a room of 20 ft X 20 ft, simply draw a room using the Room tool and then enter 20, 20 in the two text boxes given next to the cursor.

3

**Select Tool** – The Select tool helps you pick and choose multiple items to either group or move together or perform operations which can be applied on all the selected items together.

Select

5

**Upload Floor Plan** – This tool helps you upload your scanned floor plan onto the Neo canvas. Currently, Foyr NEO supports scanned images in JPG/ PNG format only. If you have your floor plan in any other format like Autocad or PDF, you will need to export them first in an image format (or take a snapshot and save it) before using in Foyr Neo.

Upload Floor Plan

Once you upload the floor plan, this is an easy way for you to trace the floor plan and draw using the wall tool or room tool on top of the floor plan. For more details on how to upload a floor plan, please refer to the help guide on the same subject.
